## For best results with new plantings, we recommend:

- \*Check your plants daily for water while they are still in their pots and for the first two weeks after planting.
- \*If soil is moist, wait a day and check again.
- \*If soil is dry, water till moist and check again the next day.
- \*The more foliage a plant has, the more water they will require. It is important to check newly planted shrubs daily.
- \*A layer of wood mulch will help with water retention. Just be careful to not smother the plant with it.
- \*Most perennials once established do not require fertilization, but Miracle-Gro plant food can be used according to the directions on the box.
- \*If you have a question about caring for a plant, we are available anytime via our e-mail address: [redgranitefarm@hotmail.com](mailto:redgranitefarm@hotmail.com)

Clematis prefer full sun, but need to have their roots shaded. Achieve this by planting a low growing perennial at the base of the plant. It is always best to mulch with compost or organic mulch rather than rock. Keep your Clematis well watered, do not allow it to dry out. Clematis have specific pruning types, listed above.

Type 1-Flowers come on old wood. Require little to no pruning. If they need to be controlled, prune after first flower flush is done.

Type 2- All first flowering comes from the previous seasons growth. In spring when you see buds begin to swell, cut off all dead material above live buds.

Type 3- These bloom on all new growth. Prune back to 12-18" in early spring before growth appears. Cut above live growth.
